

Introduction to sitemgr

Intr

one exception: The

this only works if the module puts the same variable into its output, which need not necessarily be the case.

Administrator manual

Installation

1. Once you have the site directory inside you

Introduction to system modules

Maintenance

As a site administrator, you have three

`build_input_element(($input,$default,$elementname)`

This is a helper function for the above functions. If you need one of the above functions

Introduction to system modules

names for this service to work. The `build_post_element` function can help you do this. For example let's extend our `hello` module, so that the site user can choose his own name. Since we can no longer rely on the validation that is automatically done,

1. It is written as a class called `module_name` and extends the class `Module`. It must be put into a file called `class.module_name.inc.php` and put into the include directory of any php script.
